Conflitti di interesse

Ai sensi dell'art. 3.3 sul conflitto di interessi, pag 17 del Regolamento Applicativo Stato-Regioni del 5/11/2009, dichiaro che negli ultimi 2 anni **non ho** avuto rapporti diretti di finanziamento con portatori di interessi commerciali in campo sanitario

Roma, 8-11 novembre 2018

2015 ATA guidelines

ITALIAN CHAPTER

“A major goal of these guidelines is to minimize potential harm from overtreatment in a majority of patients at low risk for disease-specific mortality and morbidity, while appropriately treating and monitoring those patients at higher risk”.

Haugen et al., THYROID Volume 26, Number 1, 2016

Roma, 8-11 novembre 2018

Le Linee Guida ATA non vengono dal pianeta Marte

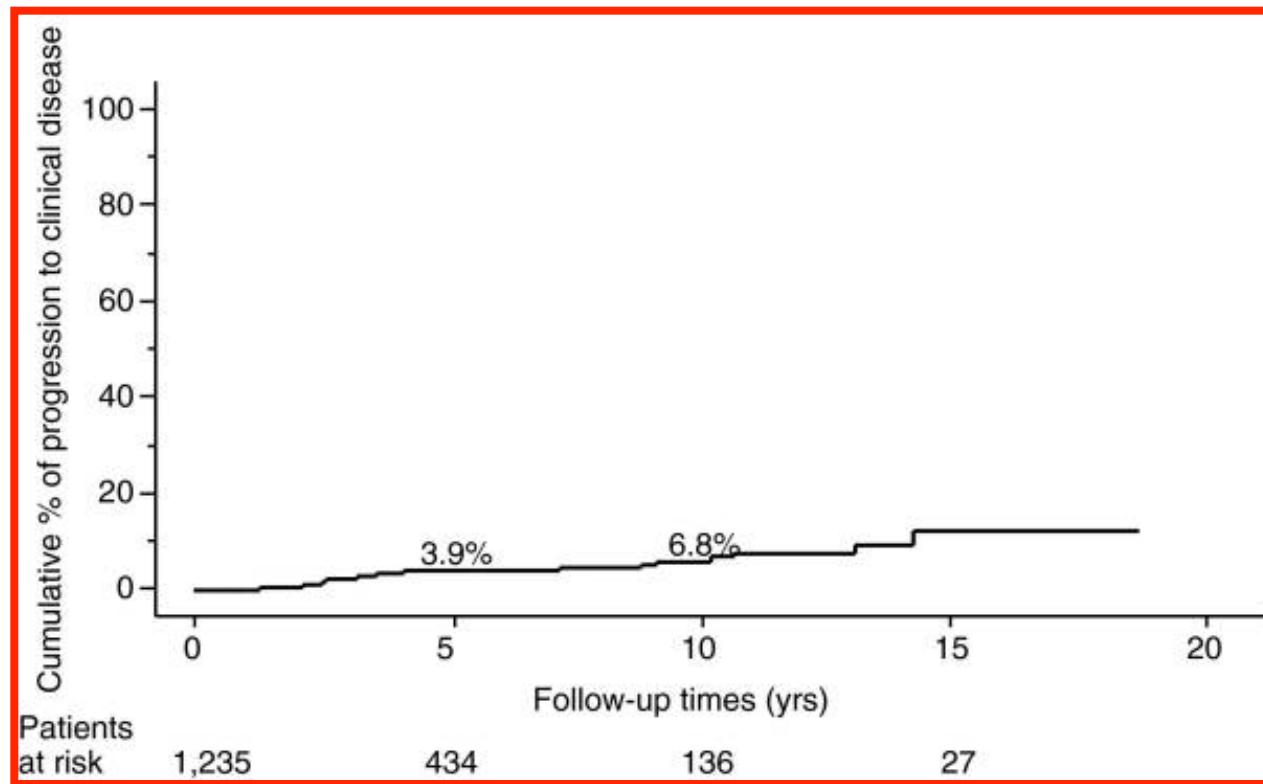

ITALIAN CHAPTER

Roma, 8-11 novembre 2018

Patients in the entire series whose PTMC developed into clinical disease

1235 patients with low-risk PTMC followed with ultrasound
Observation period: 18-227 months (average 75 months)

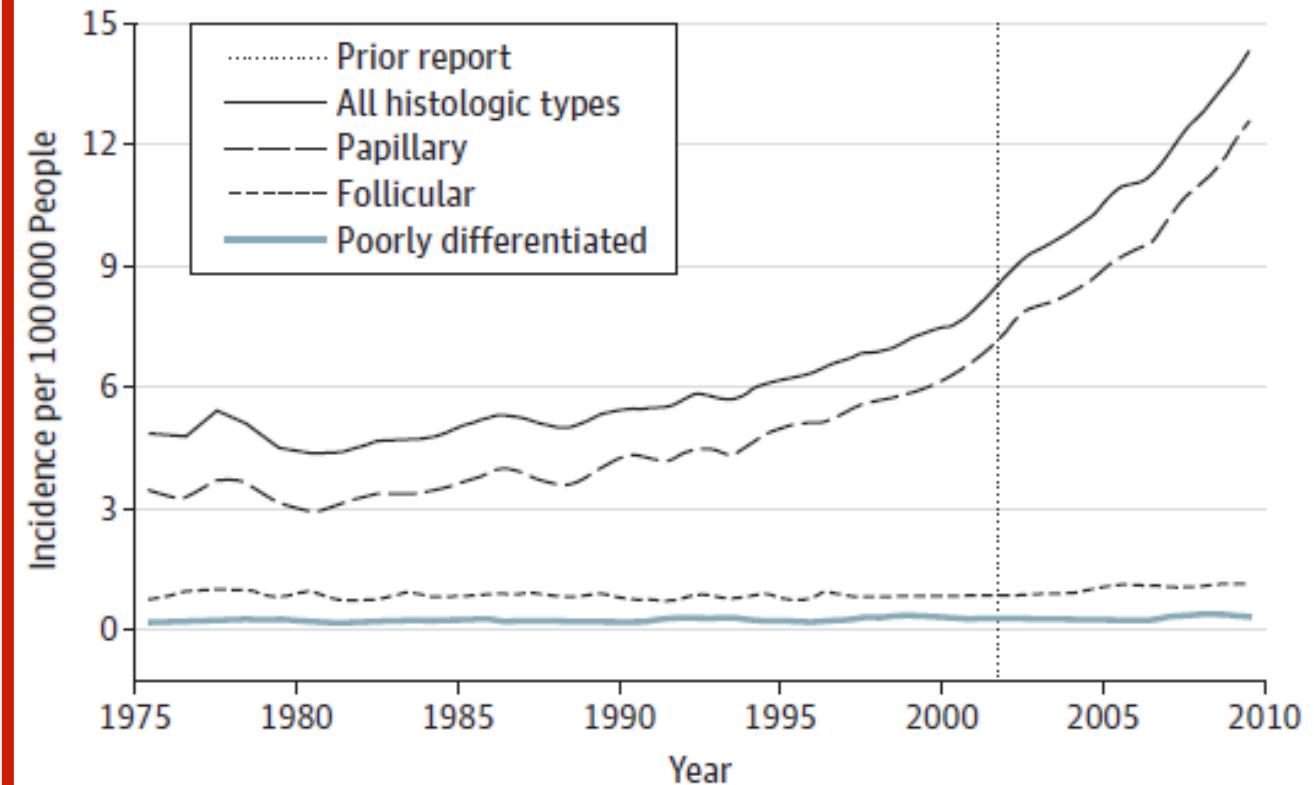

Roma, 8-11 novembre 2018

Epidemiology of thyroid carcinoma

Figure 2. Thyroid Cancer Incidence by Histologic Type, 1975 to 2009

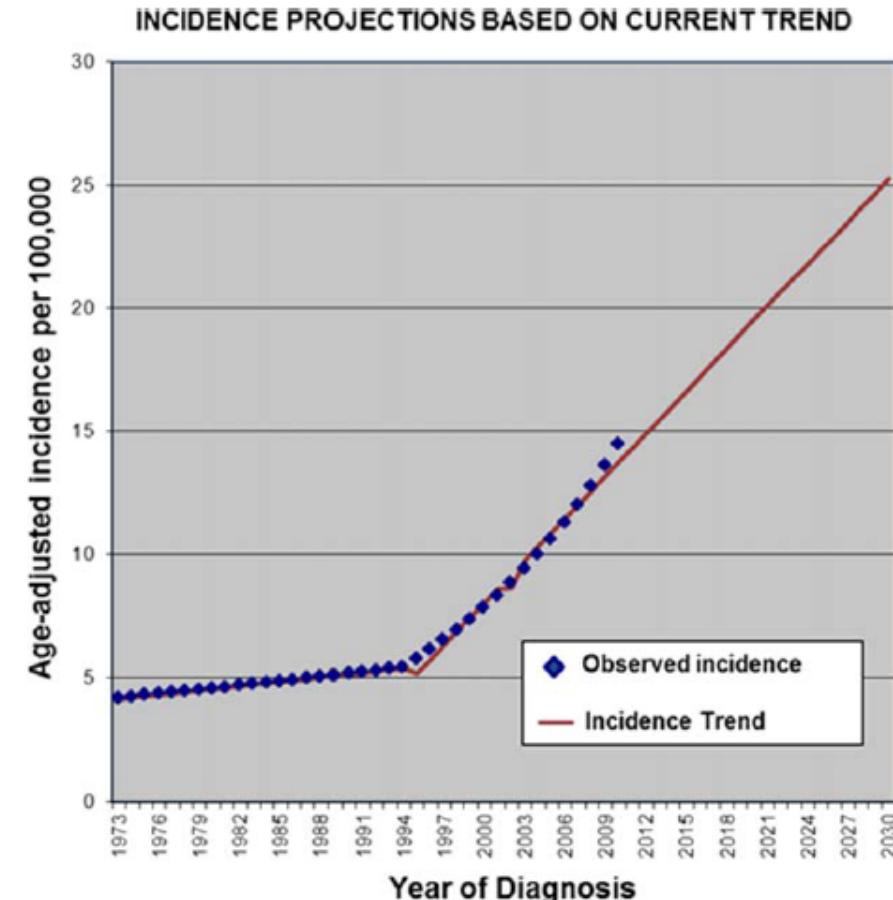

Annual Financial Impact of Well-Differentiated Thyroid Cancer Care in the United States

Roma, 8-11 novembre 2018

The care of patients with WDTC has significant economic and societal impact.

Total estimated costs associated with DTC :
2013 : ~\$1,6 billion
2030 : ~\$3,5 billion

Roma, 8-11 novembre 2018

EDITORIALS

Winding back the harms of too much medicine

- *The BMJ's Too Much Medicine campaign aims to highlight the threat to human health posed by overdiagnosis and the waste of resources on unnecessary care.*
- *There is growing evidence that many people are overdiagnosed and overtreated for a wide range of conditions, such as prostate and thyroid cancers, asthma, and chronic kidney disease.*

BMJ

Roma, 8-11 novembre 2018

PTC Incidence

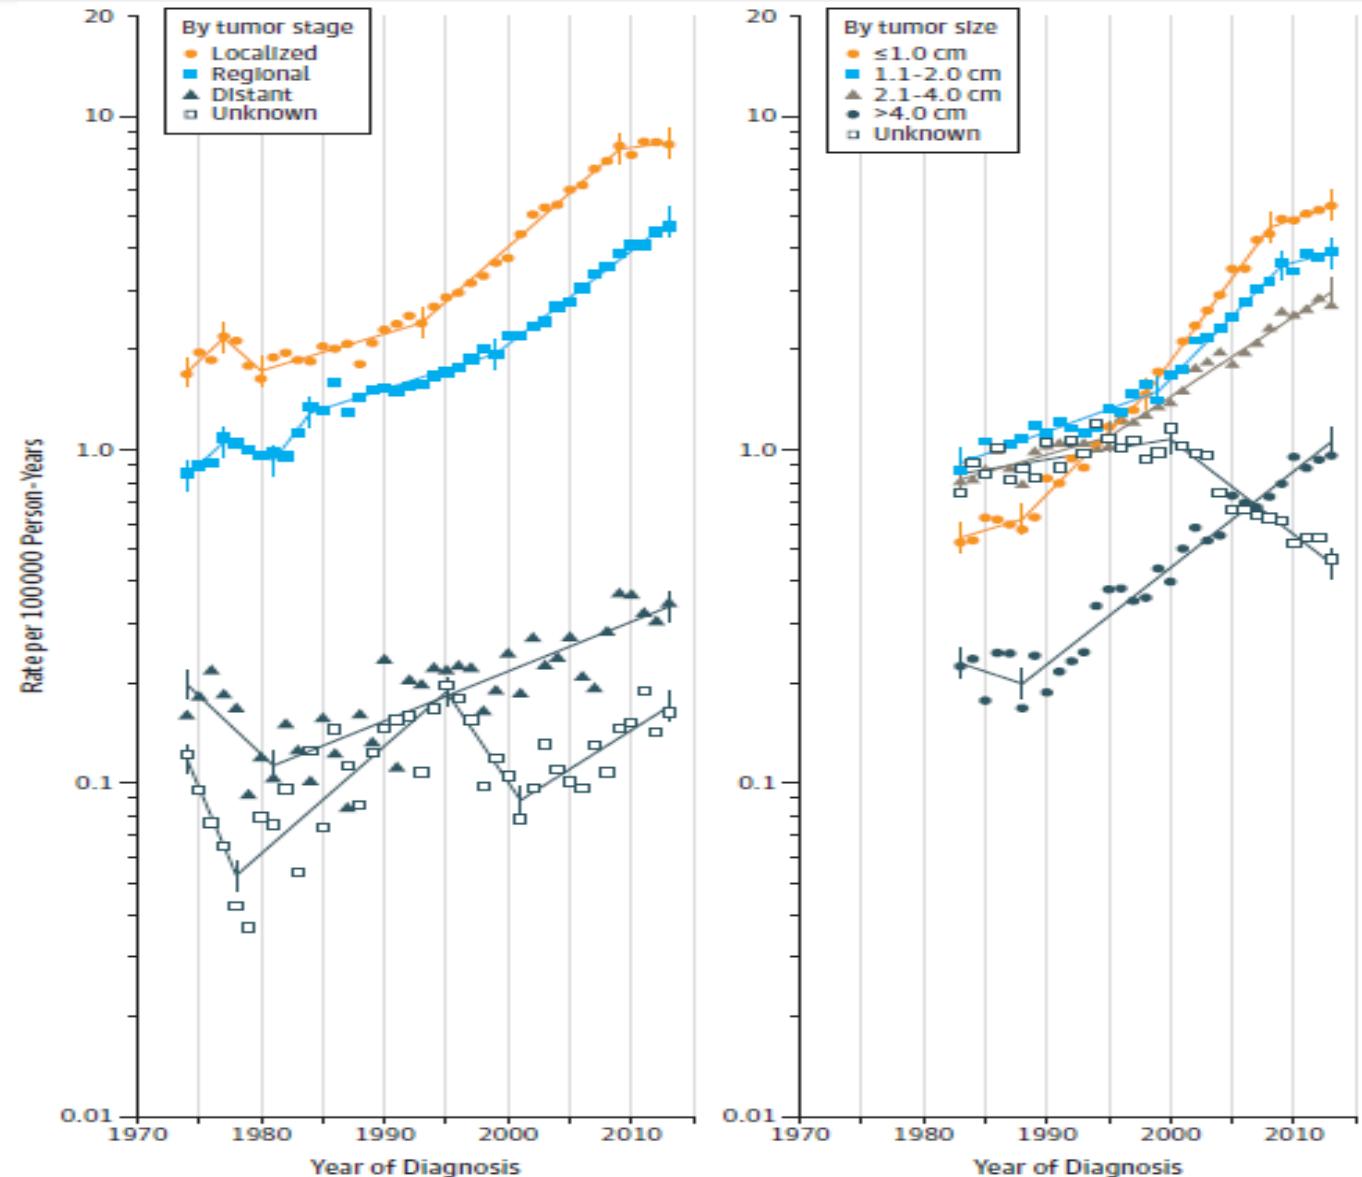

ITALIAN CHAPTER

Advanced-stage and larger PTC incidence rates have increased.

Overdiagnosis may not be solely responsible for the changing trends in PTC incidence

Lin et al., JAMA April 4, 2017 Volume 317

Roma, 8-11 novembre 2018

PTC Mortality

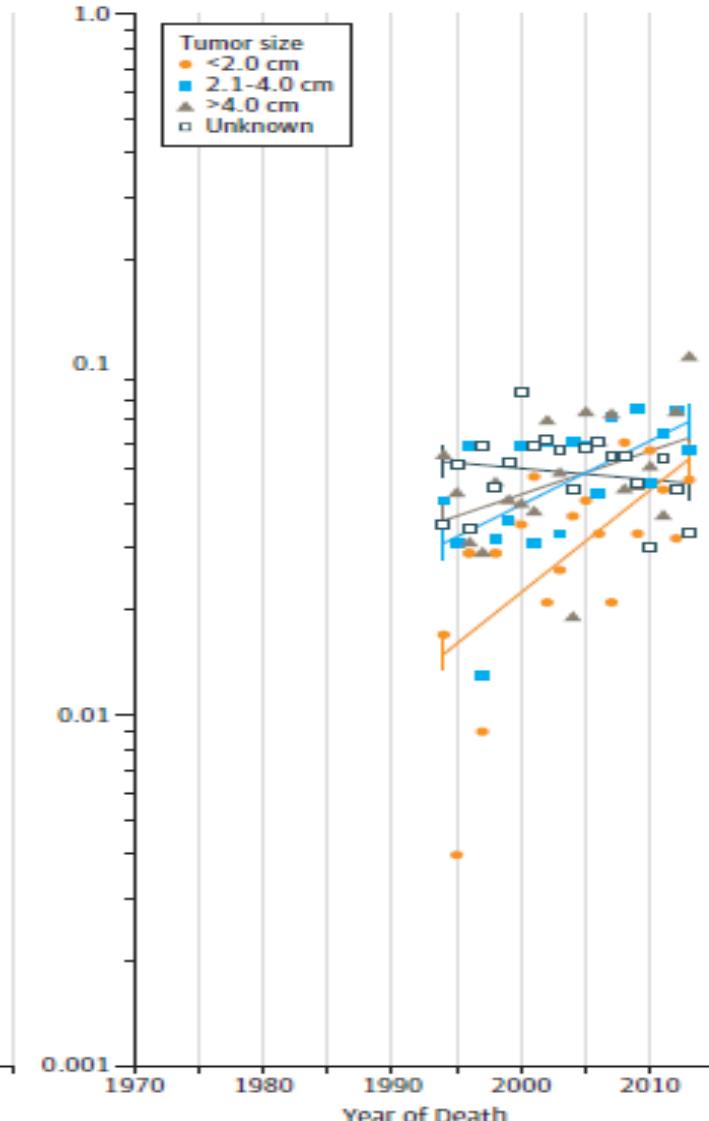

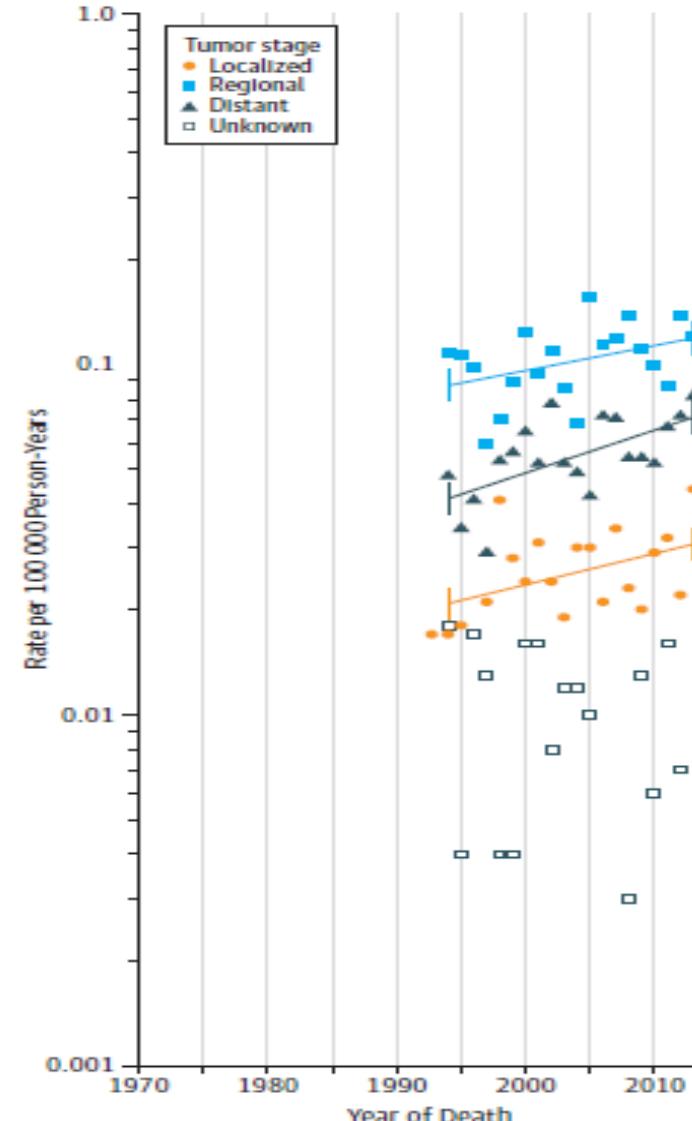

ITALIAN CHAPTER

Mortality rates among patients with advanced-stage PTC are increasing.

Hence, there should be renewed focus on aggressive management for the 5%-10% of patients who develop progressive disease.

JAMA April 4, 2017 Volume 317, Number 13

B Papillary thyroid cancer Incidence-based mortality

Roma, 8-11 novembre 2018

Is the Pendulum Swinging Too Far?

ITALIAN CHAPTER

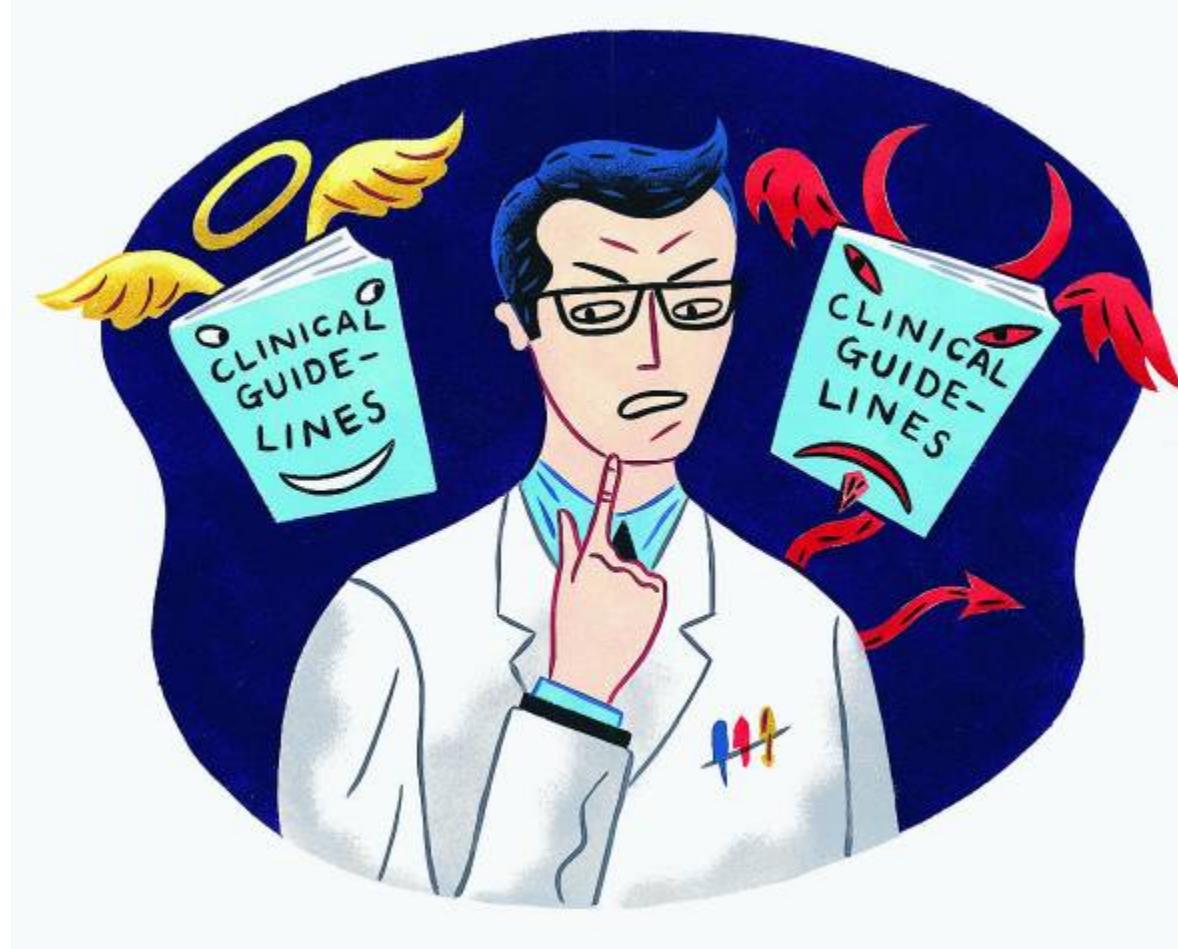

If the explanation for the rise in thyroid cancer is, indeed, not just overdiagnosis, and if mortality from thyroid cancer is also increasing, then enthusiasm for this (non)screening recommendation should be more muted.

Sosa et al., JAMA Surgery 2017 Volume 152, Number 8

Roma, 8-11 novembre 2018

Clinical Guidelines: Angels or Devils?

Woolf et al. BMJ, vol. 318 20 Feb 1999

Roma, 8-11 novembre 2018

I limiti delle linee guida

- **Firstly, scientific evidence about what to recommend is often lacking.** Guideline development groups often lack the time, resources, and skills to gather and scrutinise every last piece of evidence.
- **Secondly, recommendations are influenced by the opinions and clinical experience and composition of the guideline development group.** The beliefs to which experts subscribe can be based on misconceptions.
- **Patients' needs may not be the only priority in making recommendations.** Practices that are sub-optimal from the patient's perspective may be recommended to help control costs, serve societal needs, or protect special interests.

Woolf SH et al. *BMJ: British Medical Journal*. 1999;318(7182):527-530.

Roma, 8-11 novembre 2018

Questo significa che ...

The value judgment made by a guideline development group may be the wrong choice for individual patients.

Woolf SH, Grol R, Hutchinson A, Eccles M, Grimshaw J. Potential benefits, limitations, and harms of clinical guidelines.
BMJ: British Medical Journal. 1999;318(7182):527-530.

The Italian consensus on differentiated thyroid cancer: joint statements of six Italian societies

Roma, 8-11 novembre 2018

Background

- Differentiated thyroid cancer (DTC), mainly PTC, has emerged as the most rapidly increasing human cancer worldwide.
- The large majority of thyroid cancers detected nowadays is constituted by non-palpable small tumors escaping recognition in the previous years.
- These considerations dictate the need for the more effective, less invasive, and less expensive procedures able to guarantee the best management and the best quality of life for a disease that albeit having an intrinsic low mortality requires life-long follow-up

Roma, 8-11 novembre 2018

The Italian consensus on differentiated thyroid cancer: joint statements of six Italian societies

Scope of the document

- Several countries have developed their own guidelines or consensus reports, based on consolidated experience and cultural attitude of the country. Nevertheless, they differ in several, sometime important aspects.
- The text is not intended to represent classical guidelines, but rather a collection of practical statements on selected relevant issues, based on an adaptation of current guidelines (mainly the ATA) according to the Italian situation and the expert opinion of the multidisciplinary panel.

Roma, 8-11 novembre 2018

Caso Clinico 1 - Giulia

ITALIAN CHAPTER

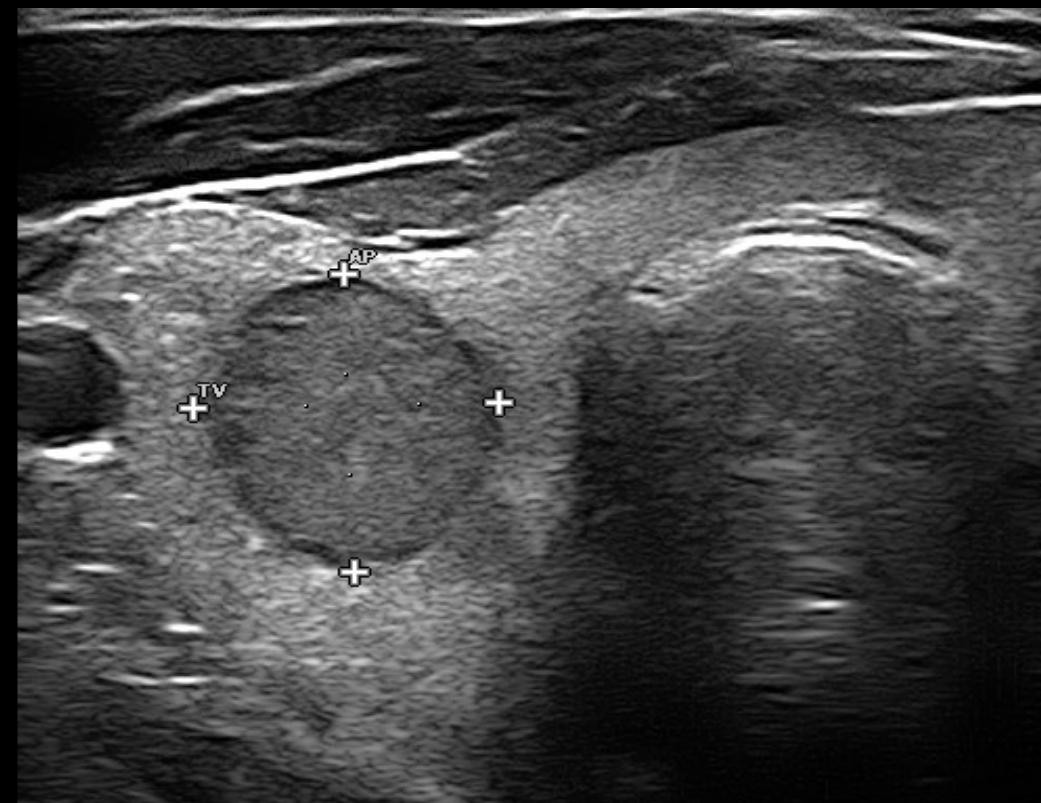

- Giulia 33 anni. Architetto
- Sposata. Una bimba di 2 anni. Non familiarità per patologia tiroidea
- Anamnesi negativa. Non assume farmaci
- Ecografia tiroidea perché una carissima amica è stata recentemente operata alla tiroide
- TSH 2.2 µU/ml

Caso Clinico 1 - Giulia

1.77 cm
1.48 cm
1.35 cm
1.9 ml

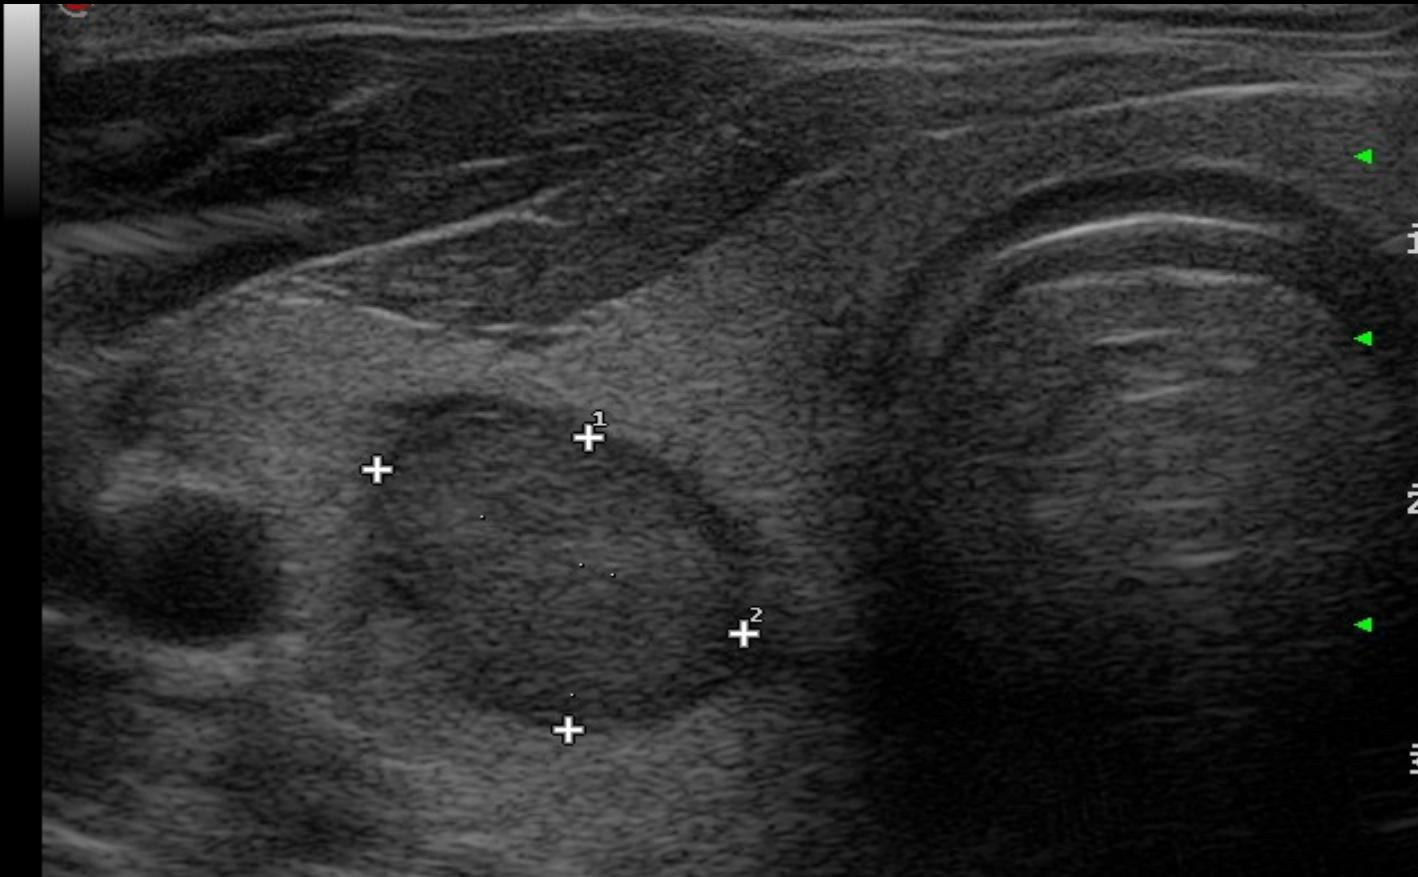

Caso Clinico 1 - Giulia

D1 1.13 cm
D2 1.40 cm

Roma, 8-11 novembre 2018

Giulia - Report ecografico

ITALIAN CHAPTER

- Tiroide nei limiti per ecostruttura e dimensioni
- Lobo tiroideo dx: nodulo solido ipoecogeno
15 x 13 x 17.5 mm Ø, margini netti e regolari
- Lobo sinistro indenne da noduli
- Non linfoadenomegalie sospette in sede cervicale

Roma, 8-11 novembre 2018

Come classificare il nodulo di Giulia?

- Probabilmente benigno
- Dubbio
- Sospetto/Maligno

Roma, 8-11 novembre 2018

FNA o wait and see?

Sottoporreste Giulia a FNA?

- Si
- No

Roma, 8-11 novembre 2018

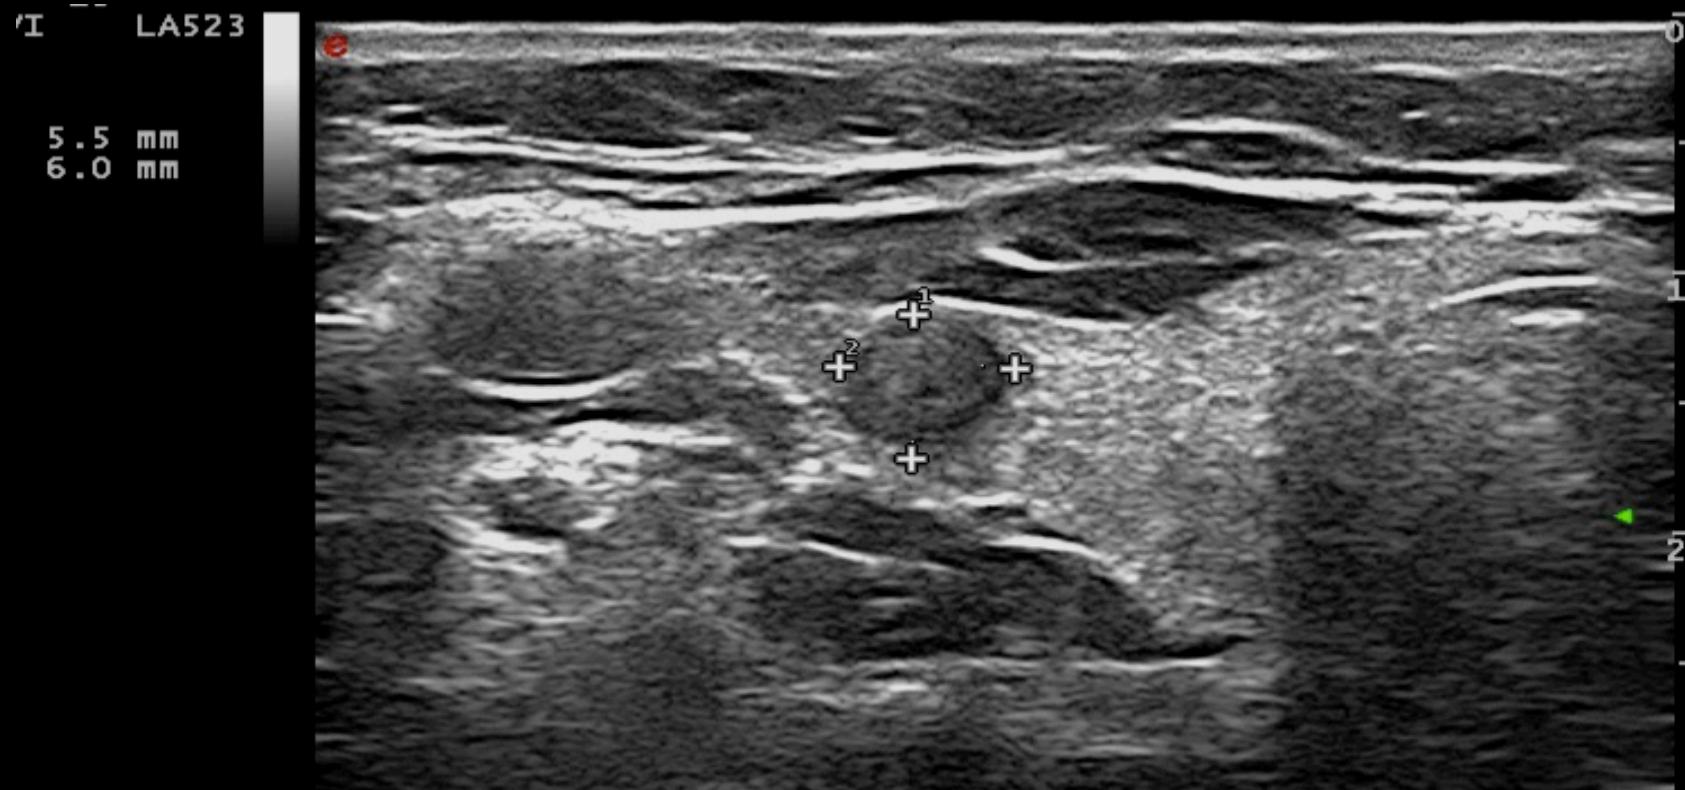

Caso Clinico 2 - Teresa

- Teresa 55 anni. Barista
- Colecistectomia all'età di 45 anni. Un fratello operato per “tumore tiroideo”
- Non assume farmaci
- Si sottopone ad ecografia tiroidea per persistente “fastidio” alla deglutizione
- TSH 1.1 µU/ml.

Roma, 8-11 novembre 2018

Definizione ecografica del rischio di malignità e indicazioni alla FNA

ITEM 1: Selection of thyroid nodules to be submitted to cytological evaluation

Class 1. Low-risk

[ROM: ≤1%]

- Purely cystic nodules.
- Mostly cystic (> 80%) nodules with reverberating artifacts.
- Spongiform, isoechoic or hyperechoic nodules not associated with suspicious US findings.

Class 2. Intermediate-risk

[ROM: 5-15%]

- Slightly hypo- or isoechoic nodules, ovoid-to-round shape, smooth or ill-defined margins.
- May be present:
 - ✓ intranodular vascularization
 - ✓ macro- or continuous rim calcifications
 - ✓ increased stiffness (elastography)
 - ✓ hyperechoic spots of uncertain significance

Class 3. High-risk

[ROM: 50-90%]

Nodules with at least one of the suspicious findings:

- marked hypoechoogenicity
- spiculated or microlobulated margins
- micro-calcifications
- taller-than-wide shape
- extrathyroidal growth or lymphadenopathy

Roma, 8-11 novembre 2018

Definizione ecografica del rischio di malignità e indicazioni alla FNA

ITALIAN CHAPTER

ITEM 1: Selection of thyroid nodules to be submitted to cytological evaluation

Class 1. Low-risk

[ROM: ≤1%]

FNA for nodules \geq 20 mm in diameter **only when**

- symptomatic
- increasing in size
- associated with high-risk factors
- before surgery or local percutaneous therapy

Class 2. Intermediate-risk

[ROM: 5-15%]

FNA for nodules \geq 20 mm in diameter

Class 3. High-risk

[ROM: 50-90%]

Diameter \geq 10 mm: FNA is recommended

Roma, 8-11 novembre 2018

Extent of Surgery for Papillary Thyroid Cancer Is Not Associated With Survival

An Analysis of 61,775 Patients

Mohamed Abdelgadir Adam, MD,* John Pura, MPH,† Lin Gu, MS,† Michaela A. Dinan, PhD,‡
Douglas S. Tyler, MD,* Shelby D. Reed, PhD,‡ Randall Scheri, MD,* Sanziana A. Roman, MD,*
and Julie A. Sosa, MD, MA*‡

Lobectomy Vs Total Thyroidectomy

=

Overall Survival

Disease free survival?

Disease specific overall survival?

Conclusions: Current guidelines suggest total thyroidectomy for PTC tumors >1 cm. However, we did not observe a survival advantage associated with total thyroidectomy compared with lobectomy. These findings call into question whether tumor size should be an absolute indication for total thyroidectomy.

TABLE 1. Patient Demographic, Clinical, and Pathologic Characteristics by Extent of Surgery (1998–2006)

	Lobectomy (%) [N = 6,849]	Total Thyroidectomy (%) [N = 54,926]	P

Michikazu Kawano · Nobuyasu Saganuma · Yasushi Rino · Munetaka Masuda ·

Kaori Kameyama · Hiroshi Takami · Koichi Ito

2014

Mean follow-up: 17.6 years

Lobectomy is a valid alternative to total thyroidectomy in selected cases:

- Age <45 years
- Tumor size ≤40 mm
- No lymph node metastases
- No extrathyroidal invasion

Roma, 8-11 novembre 2018

Lobectomy advantages

ITALIAN CHAPTER

VS Total Thyroidectomy

- **Reduced inferior laryngeal nerve injury (- 50%)**
- **No hypoparathyroidism**
- **Decreased operative time**
- **Decreased operating costs**
- **LT4 supplement (no substitutive LT4)**
- **Residual thyroid function**

Roma, 8-11 novembre 2018

REQUISITI PER L'ACCREDITAMENTO

- **Volume minimo di attività assunto: >50 interventi/anno.** Indicatori di qualità per un Centro di Riferimento I parametri, relativamente alle principali sequele o complicanze post-tiroidectomia totale, si possono attualmente così riassumere, assumendo come base quelli pubblicati dal Club delle UEC5 e come range i dati della letteratura internazionale:

- Lesione ricorrenziale permanente monolaterale 1.3% (range 0.4-4.6 %)
- Ipoparatiroidismo definitivo 2.2% (range 0.2-7.2 %)
- Sanguinamento post-operatorio 1.6% (range 0.5-4.0 %)
- Infezione ferita 0.4%

Roma, 8-11 novembre 2018

Linee guida italiane per il carcinoma differenziato della tiroide

ITALIAN CHAPTER

1. When thyroidectomy is indicated which strategy should be performed: total thyroidectomy or lobo-isthmectomy?

- a) **Thyroid lobo-isthmectomy** alone is an adequate initial surgical treatment for patients with suspicious cancer ≤ 1 cm, clinically limited to one lobe, with no evidence of extrathyroidal extension or metastatic disease to nodes (cN0b) or prior head and neck irradiation.
- b) **Total thyroidectomy** is recommended with at least one of the following parameters: patients with differentiated thyroid carcinoma >4 cm, unilateral or multifocal disease, with at least one of the following: clinically (or intraoperative) detected cervical nodal metastases, gross extrathyroidal extension or metastatic disease to distant sites.
- c) **Lobo-isthmectomy or total thyroidectomy** may be proposed to patients with differentiated thyroid carcinoma >1 and <4 cm without clinical (or intraoperative) evidence of extrathyroidal extension and lymph node metastases (N0b). Total thyroidectomy may be preferred to enable radioiodine treatment and to enhance follow-up accuracy, or for preference of the patient.

Roma, 8-11 novembre 2018

Linee guida italiane per il carcinoma differenziato della tiroide

ITALIAN CHAPTER

1. When thyroidectomy is indicated which strategy should be performed: total thyroidectomy or lobo-isthmectomy?

a) Thyroid lobo-isthmectomy alone is an adequate initial surgical treatment for patients with suspicious cancer ≤ 1 cm, clinically limited to one lobe, with no evidence of extrathyroidal extension or metastatic disease to nodes (cN0b) or prior head and neck irradiation.

Roma, 8-11 novembre 2018

Linee guida italiane per il carcinoma differenziato della tiroide

ITALIAN CHAPTER

1. When thyroidectomy is indicated which strategy should be performed: total thyroidectomy or lobo-isthmectomy?

b) Total thyroidectomy is recommended with at least one of the following parameters: patients with differentiated thyroid carcinoma >4 cm, unilateral or multifocal disease, with at least one of the following: clinically (or intraoperative) detected cervical nodal metastases, gross extrathyroidal extension or metastatic disease to distant sites.

Roma, 8-11 novembre 2018

Linee guida italiane per il carcinoma differenziato della tiroide

ITALIAN CHAPTER

1. When thyroidectomy is indicated which strategy should be performed: total thyroidectomy or lobo-isthmectomy?

c) Lobo-isthmectomy or total thyroidectomy may be proposed to patients with differentiated thyroid carcinoma >1 and <4 cm without clinical (or intraoperative) evidence of extrathyroidal extension and lymph node metastases (N0b). Total thyroidectomy may be preferred to enable radioiodine treatment and to enhance follow-up accuracy, or for preference of the patient.

ITALIAN CHAPTER

2. No intervention for papillary thyroid microcarcinoma (PTMC)

- a) Even **if surgery is the treatment of choice**, “no immediate intervention” and **active surveillance** may be considered for very low-risk PTMC in the following setting:
 1. patients at high surgical risk;
 2. patients who refuse surgical treatment;
 3. patients willing to enter into controlled clinical trials.
- b) A **personal decision making** is recommended as well as an accurate discussion with the patient to explain pro and cons of the active surveillance vs. surgical treatment.
- c) A **careful clinical and cytological evaluation** of risk factors for aggressive behaviour or recurrence of PTMC is recommended. A repeated “neck” sonographic evaluation after cytological suspicion of PTMC should be the first step to be carried out to exclude the presence of suspicious lymph nodes.

Roma, 8-11 novembre 2018

Linee guida italiane per il carcinoma differenziato della tiroide

2. No intervention for papillary thyroid microcarcinoma (PTMC)

Risk factors for aggressive behavior and recurrence of PTMC

Previous neck irradiation

Extra-thyroidal extension at US

Subcapsular or posterior localization of PTMC

Multifocal or bilateral tumor

Coexistence of Graves' disease

Suspicious lymph node involvement

Aggressive cytological features and BRAF mutation (if available).

ITALIAN CHAPTER

3. Indication for completion thyroidectomy after lobectomy.

- a) Completion thyroidectomy is indicated to those patients for whom a total thyroidectomy would be suggested as the initial surgical treatment in case of primary diagnosis of differentiated thyroid cancer.
- b) Completion thyroidectomy is mandatory for differentiated thyroid carcinoma >4 cm, or any differentiated thyroid carcinoma with extrathyroidal extension and/or with histological evidence of lymph node metastases or aggressive variants.
- c) In the other cases, completion thyroidectomy is not routinely indicated, but the final decision should be taken based on a tailored strategy involving a careful discussion with the patient.

Completion thyroidectomy is not indicated for a final histology of NIFT-P.

Consensus Statement on the Terminology and Classification of Central Neck Dissection for Thyroid Cancer

The American Thyroid Association Surgery Working Group
with Participation from the American Association of Endocrine Surgeons,
American Academy of Otolaryngology—Head and Neck Surgery, and American Head and Neck Society

Boundaries

The central neck compartment is bounded superiorly by the hyoid bone, laterally by the carotid arteries, anteriorly by the superficial layer of the deep cervical fascia, and posteriorly by the deep layer of the deep cervical fascia. Because the location of the thyroid gland is low in the neck near the thoracic inlet, the lymphatic drainage is contiguous with the anterior superior mediastinum that is accessible via a cervical approach. As a result, the inferior border of the central compartment is defined as the innominate artery on the right and the corresponding axial plane on the left (Fig. 2).

Linfadenectomia del compartimento centrale

ITALIAN CHAPTER

Controversy surrounding the role for routine central lymph node dissection for differentiated thyroid cancer

Tobias Carling, William D. Long III and Robert Udelsman

FOR

- Difficulty to pre- (with ultrasound and clinical examination) and intra-operatively evaluate lymph node involvement
- To improve accuracy in staging
- To decrease postoperative serum thyroglobulin levels
- To allow a better selection of patients for radioiodine treatment
- To reduce the recurrence rate in patients with cN0 PTC

Current Opinion in Oncology 2010, 22:30–34

AGAINST

- Higher risk of transient and permanent hypoparathyroidism
- Higher risk of unintentional laryngeal nerve injury

Absence of any significant data confirming its advantages, especially in terms of recurrence and survival rate, in patients with occult lymph node involvement

Consensus Statement on the Terminology and Classification of Central Neck Dissection for Thyroid Cancer

The American Thyroid Association Surgery Working Group
with Participation from the American Association of Endocrine Surgeons,
American Academy of Otolaryngology—Head and Neck Surgery, and American Head and Neck Society

- *Central neck dissection, bilateral:* Removal of the pre-laryngeal, pretracheal, and both the right and left paratracheal nodal basins.
- *Central neck dissection, unilateral:* Removal of the prelaryngeal, pretracheal, and one paratracheal nodal basin.

Isolated contralateral central compartment nodal metastases are exceptional (0-3.6%)

American Thyroid Association Consensus Review and Statement Regarding the Anatomy, Terminology, and Rationale for Lateral Neck Dissection in Differentiated Thyroid Cancer

Brendan C. Stack, Jr. (Chair)¹, Robert L. Ferris,² David Goldenberg,³ Megan Haymart,⁴
Ashok Shaha,⁵ Sheila Sheth,⁶ Julie Ann Sosa,⁷ and Ralph P. Tufano,^{6,*}
for the American Thyroid Association Surgical Affairs Committee

- Level I: All nodes above the hyoid bone, below the mylohyoid muscle, and anterior to a transverse line drawn on each axial image through the posterior edge of the submandibular gland.
- Level II: Extends from the skull base at the lower level of the bony margin of the jugular fossa, to the level of the lower body of the hyoid bone. Level IIA nodes are level II nodes that surround the internal jugular vein (IJV). Level IIB nodes lie posterior to the spinal accessory cranial nerve (CN) deep to the SCM and are separated from the IJV by a fat plane.
- Level III nodes lie between the level of the lower body of the hyoid bone and the level of the lower margin of the cricoid cartilage.
- Level IV nodes lie between the level of the lower margin of the cricoid cartilage arch and the level of the clavicle on each side, as seen on axial CT scan.
- Level V nodes extend from the skull base at the posterior border of the attachment of the SCM to the level of the clavicle. Level Va nodes lie between the skull base and the level of the lower margin of the cricoid cartilage arch, behind the posterior edge of the SCM. Level Vb nodes lie between the level of the lower margin of the cricoid cartilage and the level of the clavicle (31).

4. The role of central and lateral compartment neck dissection in the management of differentiated thyroid carcinoma.

- a) Prophylactic central compartment neck dissection (CCND) is not routinely indicated.
- b) CCND is appropriate for patients with differentiated thyroid carcinomas in the presence of clinically involved lymph nodes (cN1) either in the central compartment or in the lateral neck.
- c) Lateral neck dissection is appropriate for patients with differentiated thyroid carcinomas in the presence of metastatic lymph nodes (cN1) in the lateral neck.
- d) Intraoperative surgeon judgement is critical to decision making on whether central neck dissection is to be performed.

Roma, 8-11 novembre 2018

Castagna et al, Eur J Endocrinol, 2011

ITALIAN CHAPTER

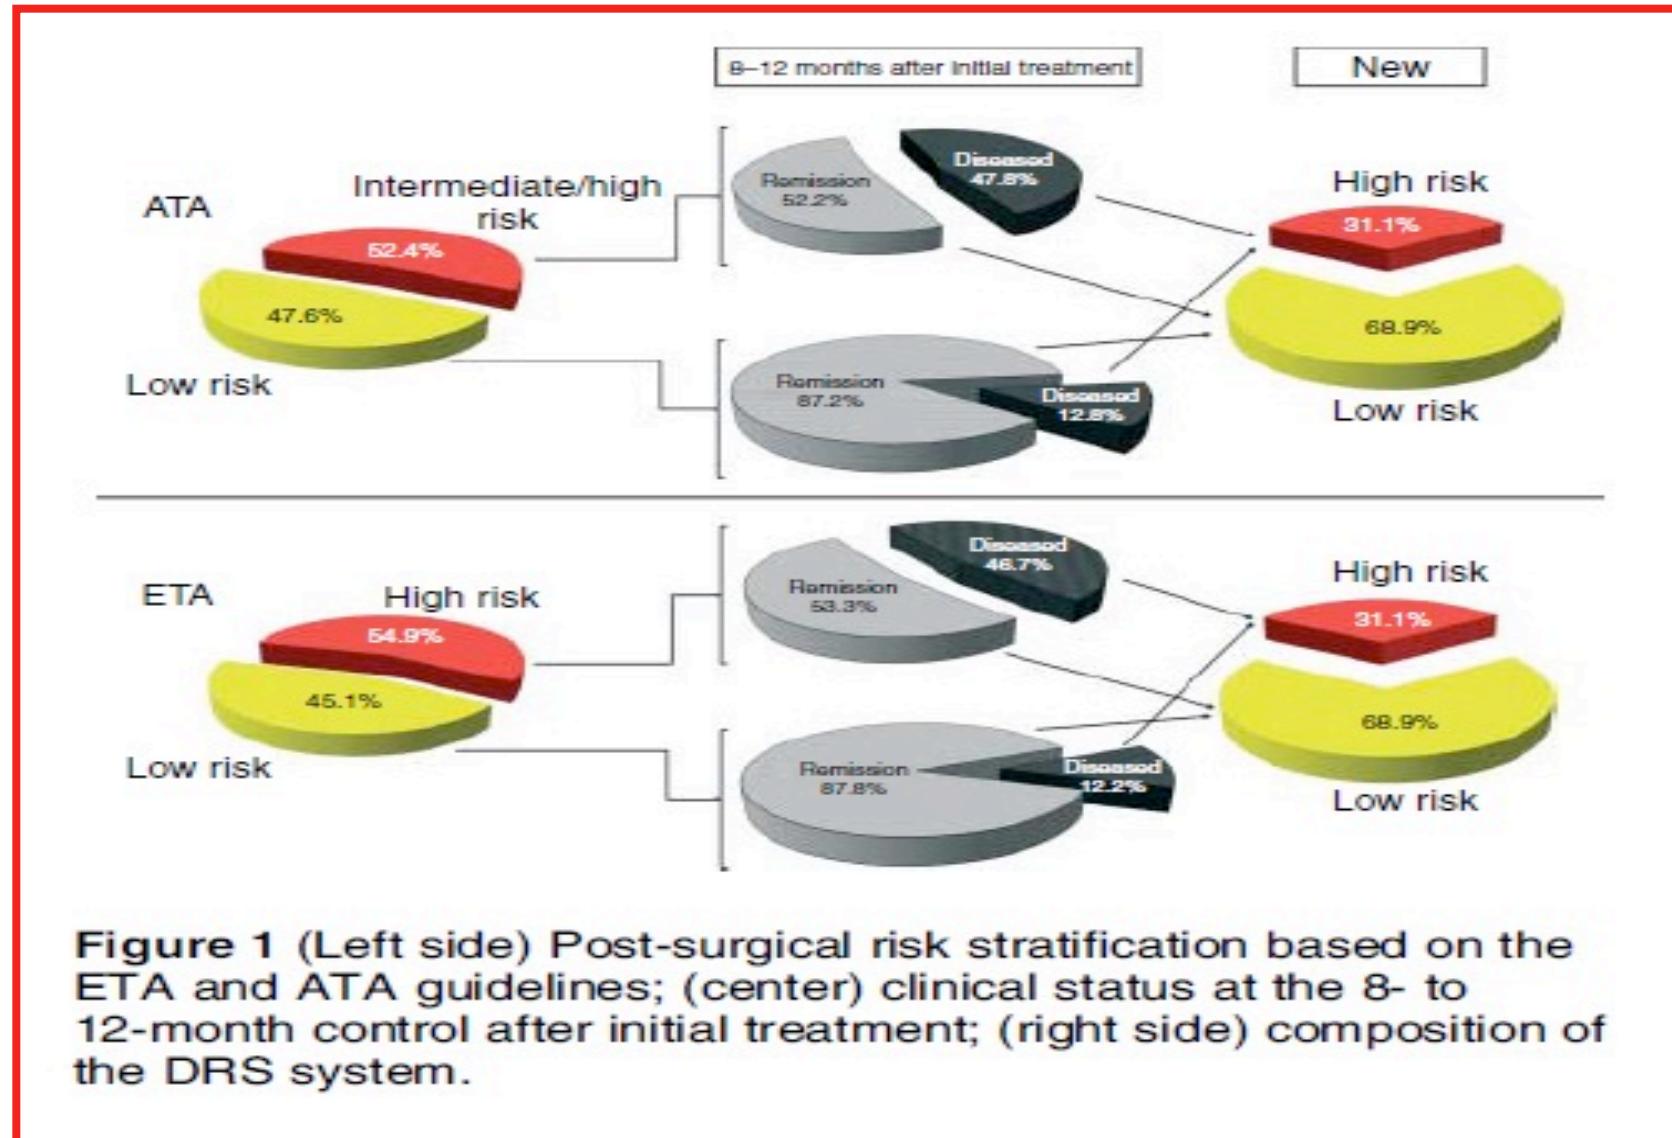

Figure 1 (Left side) Post-surgical risk stratification based on the ETA and ATA guidelines; (center) clinical status at the 8- to 12-month control after initial treatment; (right side) composition of the DRS system.

Roma, 8-11 novembre 2018

Why should we care about this re-stratification?

1) Patients want to know about their prognosis

The pathology can give us an idea but then we will see during FU ...

After the evidence of clinical remission we can better predict the risk of recurrence!!!

2) To decide the strategy of follow-up: frequency of controls

After clinical remission:

- Every 18 months when the risk of recurrence is low
- Every 8-12 months when the risk of recurrence is higher

Not cured patients:

- Every 12 months when there is a "biochemical" disease
- Every 6 months when there is a "structural" disease

3) To move from LT4 suppressive to LT4 substitutive therapy

A prolonged LT4 suppressive therapy increases the risk to develop cardiac problems and/or osteoporosis especially in older patients

Roma, 8-11 novembre 2018

Risk stratification incorporating the response to initial treatment

Recommendation statement:

- The ATA Initial Risk Stratification System is recommended for all DTC patients treated with thyroidectomy
- The initial recurrence risk estimates should be modified to incorporate the response to initial therapy
- Risk estimates should be further modified during follow-up, as a function of the clinical course of the disease.

Roma, 8-11 novembre 2018

Response to initial therapy

- **Excellent response:** Negative or non-specific structural or functional imaging findings and either suppressed Tg <0.2 ng/mL
or
TSH-stimulated Tg <1 ng/mL
- **Biochemical incomplete response:** Detectable basal or stimulated Tg or rising anti-Tg antibody levels and negative imaging
- **Structural incomplete response:** Evidence of disease at structural or functional imaging, with any Tg level, with or without anti-Tg antibodies.

Roma, 8-11 novembre 2018

First Follow-up evaluation after initial treatment (surgery + ^{131}I)

- First follow-up visit (\rightarrow response to primary treatment) at 6 -12 months
- Evaluation based on :
 - serum Tg on L-T4 with a sensitive Tg assay or after rhTSH
 - serum TgAb;
 - neck US
- Functional (^{131}I WBS, ^{18}FDG PET) and/or morphologic (CT, MR) evaluation should be considered in patients at high risk of persistent disease
- In case of US evidence of suspicious neck lesions, FNA cytology + FNA-Tg recommended (if FNA results would change the management)

Dynamic Risk Stratification in Patients with DTC Treated Without Radioactive Iodine

Roma, 8-11 novembre 2018

DP. Momesso, F Vaisman, SP. Yang, DA. Bulzico, R Corbo, M Vaisman, and RM Tuttle

JCE&M, 2016

The definition of the response to initial treatment

Table 1. Response to Therapy Assessment Definitions Based on Initial Therapy

	TT Without RAI Ablation	Lobectomy
Excellent response: No clinical, biochemical or structural evidence of disease	Nonstimulated Tg < 0.2 ng/mL or stimulated Tg < 2 ng/mL and undetectable TgAb and negative imaging	Stable, nonstimulated Tg < 30 ng/mL and undetectable TgAb and negative imaging
Biochemical incomplete response: Abnormally elevated serum Tg or increasing TgAb levels in the absence of localizable disease	Nonstimulated Tg > 5 ng/mL or stimulated Tg > 10 ng/mL or increasing Tg values over time with similar TSH levels or increasing TgAb levels and negative imaging	Nonstimulated Tg > 30 ng/mL or increasing Tg values over time with similar TSH levels or increasing TgAb levels and negative imaging
Structural incomplete response: Persistent or newly identified locoregional or distant metastases with or without abnormal Tg or TgAb	Structural or functional evidence of disease regardless of Tg or TgAb	Structural or functional evidence of disease regardless of Tg or TgAb
Indeterminate response: Nonspecific biochemical or structural findings which cannot be confidently classified as either benign or malignant	Nonspecific findings on imaging studies or Faint uptake in thyroid bed on RAI scanning or nonstimulated Tg 0.2–5 ng/mL or stimulated Tg 2–10 ng/mL, or TgAb levels stable or declining in the absence of structural or functional disease	Nonspecific findings on imaging studies or TgAb levels stable or declining in the absence of structural or functional disease

**EXCELLENT RESPONSE: NEGATIVE NECK US, LOW AND STABLE LEVELS OF SERUM Tg,
(cured) NEGATIVE AbTg**

On going risk stratification

Stable levels of serum Tg, negative neck US, negative AbTg: ***LOW RISK OF RECURRENCE, relaxed follow up with 12-18 months controls***

Increasing trend of serum Tg and negative neck US: ***INTERMEDIATE RISK OF RECURRENCE, need to carefully follow the serum Tg increase and calculation of DT***

Stable or increasing levels of serum Tg and evidence of suspicious lymphnode or suspicious nodule in the remnant lobe: ***HIGH RISK OF RECURRENCE, need of further investigation (i.e. FNAC)***

Post-surgical thyroid ablation with radioiodine: routine or selective indication

Roma, 8-11 novembre 2018

Goals of RAI Therapy in DTC

ITALIAN CHAPTER

RAI therapy type	Goal	Potential benefit
Remnant ablation	Destroy normal thyroid tissue remaining after total thyroidectomy	Improve initial staging; facilitate highly sensitive follow-up
Adjuvant treatment	Destroy subclinical microscopic tumor deposits that may be present	Decrease recurrence; improve disease-specific survival
Treatment of known residual/recurrent disease	Destroy known residual/recurrent disease	Achieve excellent response (remission)
		Improve disease-specific survival
		Improve progression-free survival

Roma, 8-11 novembre 2018

Indication to RAI Remnant Ablation

ITALIAN CHAPTER

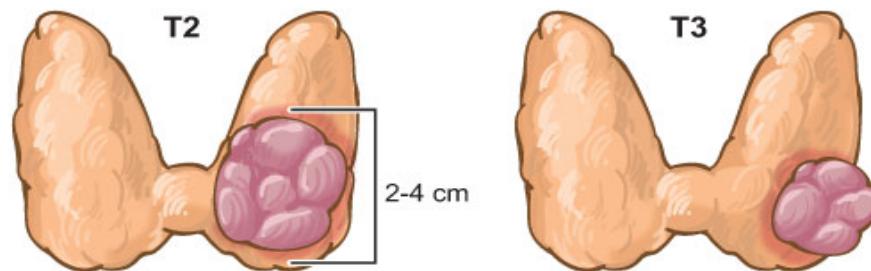

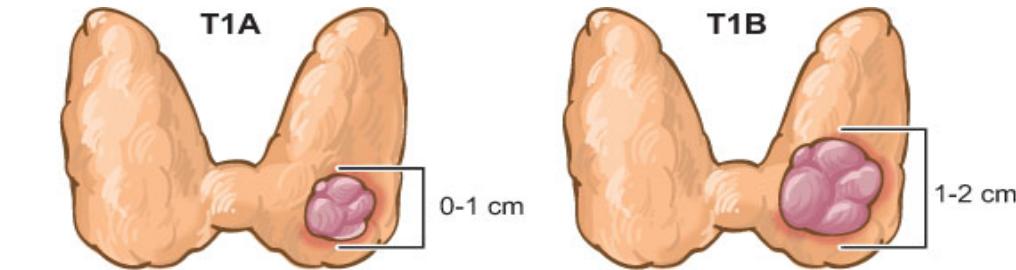

- a) The indication ... should be established both on the basis of the AJCC/UICC staging (VIII edition) and the Initial Risk Stratification System proposed by ATA, useful to predict the risk of mortality and of disease recurrence/persistence, respectively.
- b) The indication should also be based on the postoperative disease status evaluated by serum Tg ... and neck US. In selected cases, other imaging procedures (including diagnostic RAI WBS) may be indicated.

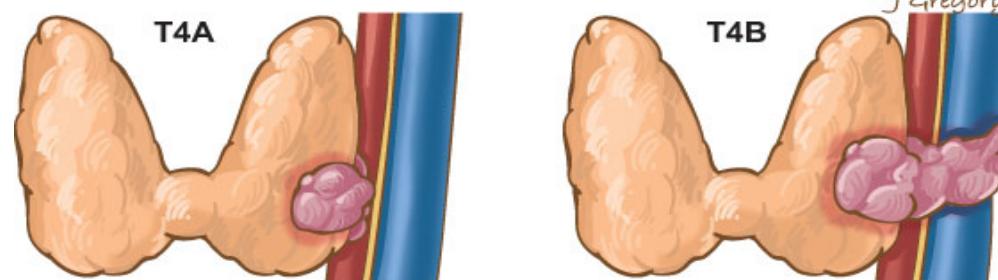

TNM (VIII edition)

ATA Initial Risk Stratification System

ITALIAN CHAPTER

Roma, 8-11 novembre 2018

Indication to RAI Remnant Ablation

ITALIAN CHAPTER

ATA low-risk

T1a-b, N0-Nx, M0-Mx

Not generally recommended.

However, consideration of specific features could lead to consider the RAI remnant ablation in individual patients.

ATA intermediate or low-to-intermediate risk

T1-2, N1a-b, M0-Mx

Should be considered, particularly in patients with adverse features such as advanced age, larger tumors, macroscopic or clinically evident lymph nodes or presence of extranodal extension, or aggressive histology or vascular invasion.

Roma, 8-11 novembre 2018

Indication to RAI Remnant Ablation

ITALIAN CHAPTER

ATA high or intermediate-to-high risk

T3-4, any N, any M

RAI ablation is routinely recommended.

Tutti d'accordo?

INVITED PERSPECTIVE

Controversies on the Use of Radioiodine in Thyroid Cancer: We Need More and Better Data

Daniel A. Pryma

Division of Nuclear Medicine & Clinical Molecular Imaging, Department of Radiology, Perelman School of Medicine at the University of Pennsylvania, Philadelphia, Pennsylvania

- There is a lack of randomized controlled trials
- More than 16 different staging systems are used to define “risk”
- Definition of “low risk” varies across studies
- Few studies include assessment of postoperative disease status
- Few data are specific to the “adjuvant treatment” cohort
- Histologic heterogeneity exists in differentiated thyroid cancer
- Likelihood of RAI avidity is not considered
- Event rates are often small
- Events can occur decades after diagnosis
- Preoperative imaging has improved over time
- Methods for detecting recurrent disease have improved over time

Item 10

ITALIAN CHAPTER

Selection of the most appropriate activity of radioiodine for remnant ablation

- In patients with **low-risk or intermediate-risk** thyroid cancer, a low administered activity of radioiodine (**30-50 mCi**) for remnant ablation is generally favored being low activities as effective as high activities in obtaining complete ablation.

Roma, 8-11 novembre 2018

Item 10

ITALIAN CHAPTER

- Higher administered activities (**100 mCi or more**) should be considered for patients at **high risk** of persistent/recurrent disease, when the administration is intended in terms of **adjuvant therapy** or for patients submitted to **less than a total** or near-total **thyroidectomy**.

THYROID CANCER AND NODULES

Estimating Risk of Recurrence in Differentiated Thyroid Cancer After Total Thyroidectomy and Radioactive Iodine Remnant Ablation: Using Response to Therapy Variables to Modify the Initial Risk Estimates Predicted by the New American Thyroid Association Staging System

R. Michael Tuttle,¹ Hernan Tala,¹ Jatin Shah,² Rebecca Leboeuf,¹ Ronald Ghossein,³ Mithat Gonen,⁴ Matvey Brokhin,¹ Gal Omry,¹ James A. Fagin,¹ and Ashok Shaha²

The initial recurrence risk estimates should be modified to incorporate the response to initial therapy

Risk estimates should be further modified during follow-up, as a function of the clinical course of the disease

Roma, 8-11 novembre 2018

Teresa
Cytology TIR3B
Total thyroidectomy + 131I pT1N0

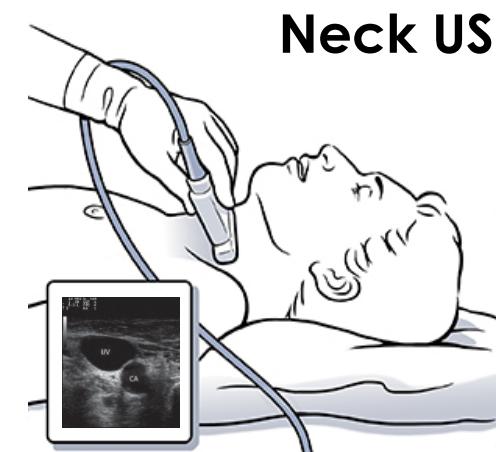

First follow up visit

6-12 months after initial treatment
Evaluation of the RESPONSE

**sensitive Tg or rhTSH
stimulated Tg + AbTg**

Roma, 8-11 novembre 2018

Response to initial therapy

Excellent response

Basal Tg <0.2 ng/ml or rhTSH Tg <1 ng/ml

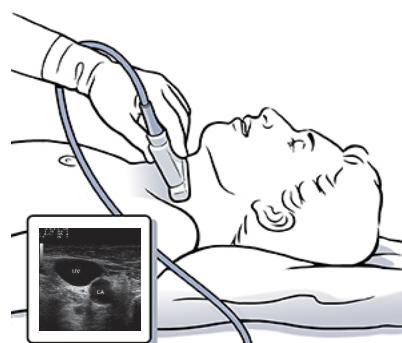

Negative or non-specific structural or functional imaging findings

Biochemical incomplete response

Detectable basal or stimulated Tg or rising anti-Tg antibody levels

Negative imaging

Structural incomplete response

Evidence of disease at structural or functional imaging, with any Tg level, with or without anti-Tg antibodies

Roma, 8-11 novembre 2018

Follow-up of patients with excellent response to initial therapy

Excellent response

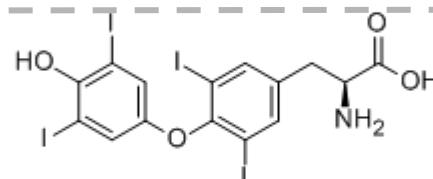

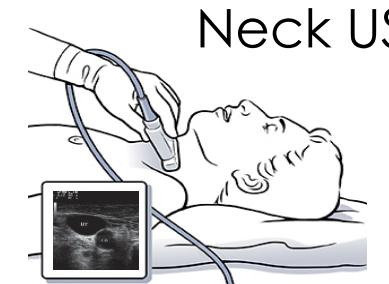

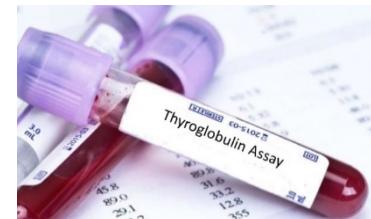

Basal Tg <0.2 ng/ml or rhTSH Tg <1 ng/ml

Negative or non-specific structural or functional imaging findings

Follow up visits every 12-24 months

sensitive Tg (<0.2 ng/ml), Ab Tg on L-T4

TSH levels in the low normal range → 0.5-2 mUI/L

Roma, 8-11 novembre 2018

Follow-up of patients with persistent biochemical disease

Biochemical incomplete response

Detectable basal or stimulated Tg or rising anti-Tg antibody levels

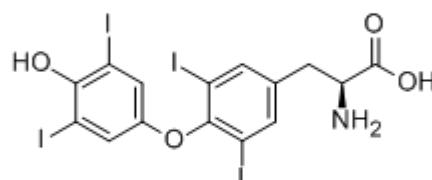

Negative imaging

Follow up visits every 6-12 months

Tg doubling time <12 months

additional morphological examinations

Moderate (0.1-0.5 mU/l) or complete (<0.1 mU/l)
TSH suppression

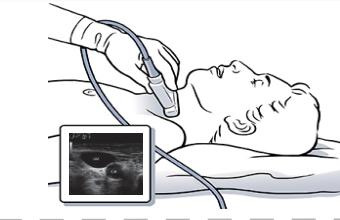

Roma, 8-11 novembre 2018

contralateral lobe recurrences

recurrent disease in cervical LNs

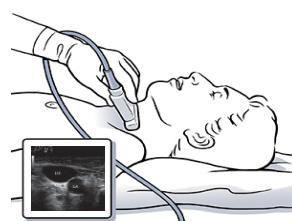

Kim et al., 2018

Roma, 8-11 novembre 2018

Response to initial therapy

Excellent response

Low, stable basal Tg levels

Negative or non-specific structural or functional imaging findings

Biochemical incomplete response

Elevated non-stimulated Tg levels or Tg levels increasing over time

Negative imaging

Structural incomplete response

Evidence of disease at structural or functional imaging, regardless of serum Tg levels

Indeterminate response

Nonspecific findings on US and /or Tg trend not assessable, positive serum Tg Ab

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

[B43] Early management of DTC after initial therapy

[B44] What is the appropriate degree of initial TSH suppression?

■ RECOMMENDATION 59

E) For low risk patients who have undergone lobectomy, TSH may be maintained in the mid to lower reference range (0.5 – 2 mU/L) while continuing surveillance for recurrence. Thyroid hormone therapy may not be needed if patients can maintain their serum TSH in this target range. (**Weak recommendation, Low-quality evidence**)

Item 23: L-Thyroxine therapy after total thyroidectomy or lobo-isthmectomy

Recommendation statement

Degree of TSH suppression after initial treatment

The degree of initial TSH suppression depends on the risk classification after initial treatment. Age and comorbidities should also be considered.

Degree of TSH suppression during follow-up [1]

The degree of TSH suppression depends on the ongoing risk classification. Age and comorbidities should also be considered.

Note: In patients treated by lobectomy and living in an iodine deficient country, L-thyroxine treatment may be considered to reduce the TSH-induced thyroid nodular hyperplasia of the residual lobe, considering, age, TSH levels and ultrasound feature of the remaining lobe.

Roma, 8-11 novembre 2018

LG Italiane 2018 per il carcinoma differenziato tiroideo

THMs

Roma, 8-11 novembre 2018

The time of “one treatment fits all” has definitely come and gone

Roma, 8-11 novembre 2018

La gestione del carcinoma tiroideo differenziato nel 2018: THMs

- L'obiettivo delle linee guida ATA 2015 è stato quello di contrastare overdiagnosis e overtreatment. Non mancano tuttavia segnali di una possibile oscillazione del pendolo in una direzione opposta nei prossimi anni.
- È certamente necessario sottolineare l'importanza della chirurgia conservativa e considerare l'opzione della "soveglianza attiva" in casi selezionati di pazienti con PMC; dobbiamo al tempo stesso essere consapevoli che una quota non trascurabile dei nostri pazienti potrebbe avere beneficio dalla tiroidectomia totale e dalla successiva terapia ablativa.
- Abbiamo bisogno di maggiori dati sulla rilevanza prognostica dei marcatori molecolari ed istologici per migliorare l'accuratezza delle nostre decisioni cliniche.

Roma, 8-11 novembre 2018

Active surveillance for PTMC: Italian consensus statement

Recommendation statement

- (a) Even if surgery is the treatment of choice, “no immediate intervention” and active surveillance may be considered for very low-risk PTMC in the following setting:
 1. patients at high surgical risk;
 2. patients who refuse surgical treatment;
 3. patients willing to enter into controlled clinical trials.
- (b) A personal decision making is recommended as well as an accurate discussion with the patient to explain pro and cons of the active surveillance vs. surgical treatment.
- (c) A careful clinical and cytological evaluation of risk factors for aggressive behavior or recurrence of PTMC is recommended.

Roma, 8-11 novembre 2018

PMTC candidate to active surveillance

- **Ideal candidate:** an older patient with a solitary PMC with well-defined nodule margins, not adjacent to the thyroid capsule and confined to the thyroid parenchyma.
- **Appropriate candidate:** younger patients with multifocal disease, adjacent to the thyroid capsule at noncritical locations, a potentially more aggressive molecular phenotype, or other US findings likely to make follow-up more difficult (thyroiditis, nonspecific lymphadenopathy, or other benign-appearing nodules).
- **Inappropriate candidate:** patients with tumors in critical subcapsular locations (adjacent to the recurrent laryngeal nerve or trachea), and evidence of spread outside the thyroid by either direct extension or metastases, or evidence of disease progression.

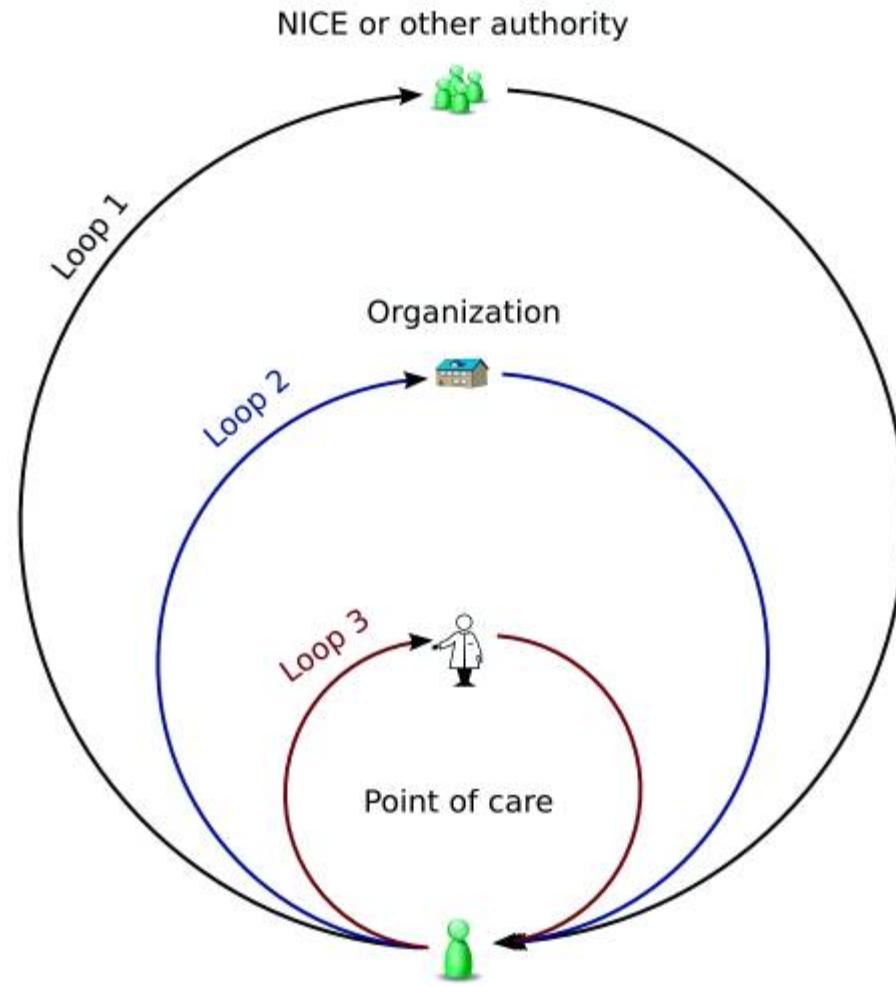

Roma, 8-11 novembre 2018
